

A company overview...

Elettric 80 is a global provider of end-of-line automation solutions which increase operational profitability and efficiency – put simply our technology helps companies cut cost and move product out of the warehouse in a fast and effective manner. Due to years of experience, we understand the storage handling challenges faced by many companies and have subsequently developed a systematic approach which is proven and underpinned by continuous investment in research and development.

Above all we value our partner approach and are committed to maintaining a track record of supplying solutions which are flexible, durable and provide a long term return on investment. Our proposition is based on Freeway® - an innovative and unique approach to end-of-line logistics which provides our clients with a clear competitive edge.

Freeway® is a highly flexible material handling system which utilizes palletizing robots, Laser Guided Vehicles (LGVs), high speed wrappers (Silk-worm) and a pallet control system. The entire process is managed centrally by a state-of-the-art Warehouse Management System (WMS). During all phases of the implementation process an experienced team is at hand to assist and advise on the deployment of the solution, from the initial concept and planning through simulations and development to after sales support. The benefits of using the system are numerous:

- **Low maintenance;**
- **An immediate improvement in operational performance;**
- **Speed and agility at the end-of-the-line;**
- **Real-time checks on load data;**
- **A safer work environment;**
- **Rapid installation and minimal disturbance to production; and**
- **Scalability.**
